                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGP) factor betal (TGP-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGP-bl and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention The peptides act by competitive inhibition of the binding of TGP-bl to its receptors, e.g. they are inhibitors of stimulation of collagen synchesis in liver cells and inhibitors of stimulation of collagen synchesis in liver cells and inhibitors such that the peptides, their mimeropes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Heparotropic, antagonist; transforming growth factor betal; TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                             Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
                                                                                                                                                                                                                           ö
those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial anino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAV92945-Y9313 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hepatotropic, antagonist, transforming growth factor betal, TGF-b1, competitive inhibition; collagen synthesis stimulation inhibitor, liver, extracellular matrix degradation inhibitor; mimetope, cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lasarte Sagastibelza JJ, Prieto Valtuena J;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-b1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAX92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes alle to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver
                                                                                                                                                                                                                                                         Hepatotropic, antagonist, transforming growth factor betal, TGF-bl; competitive inhibition, collagen synthesis stimulation inhibitor, liver, extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

WPI; 2001-639362/73 N-PSDB; AAS89820 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

Claim 20; SEQ ID NO 55992; 103pp; English. biodiversity.

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain creation (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed constant of the constant of

Novel peptides useful for activating neutrophils or blocking activation of neutrophils, modulating homotypic or heterotypic adhesion of Cp66 polypeptides, and modulating immune cell activation.

Claim 1; Page 54; 102pp; English.

The present sequence is an isolated peptide that was tested for its ability to modulate the function of CD66 family polypeptides and CD66 ilgands. 106 sequences of 13 or 14 amino acids in length, and their analogues, were identified that modulate the function of at least one cD66 family polypeptide and/or at least one ligand of the polypeptide. The peptides are capable of modulating activation of neutrophils, activation or inhibition, proliferation and/or differentiation of T-cells, B-cells, NK cells, LAK cells, dendritic cells, or other immune system cells, proliferation and/or differentiation of F-cells, not beterotypic adhesion and/or differentiation of Epithelial cells, homotypic and/or heterotypic adhesion and or heterotypic adhesion and conference of the peptides and adhesion of CD66 family polypeptides to other ligands. The peptides and adhesion of calivering a therapeutically active agent to a patient, for useful for delivering at hemapeutically active agent to a patient, for modifying the metastasis of malignant cells, for altering bacterial or viral binding to cells or almoure cells, for altering angiogenesis by contacting endothelial cells, tumoure for its ligand, for altering angiogenesis by immune response, and for altering keratinocyte proliferation

                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                   Protected melittin-(7-21) and twelve analogs (AAR13969-79) derived by substitutions in position 12 and 14 were each assembled stepwise on a labelled sheet. The sheet was an aminomethylated 285$ polystyrenegrated beheet. The sheet labelled by graphite-based ink. The common steps of deprotection, neutralisation, washing and coupling of identical amino acids were performed simultaneously in a single reaction vessel, while the coupling of different amino acids was carried out in separate vessels. The polymer substrate serves as an efficient solid-phase carrier on which the peptide may be synthesised or attached and remain covalently bound in a stable, permanent manner. The resulting support can be used in solid-phase bloassays, esp. (updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                Polymer substrate with grafted polystyrene chains - functionalised to attach aminoacid(s), peptide(s) or proteins, for peptide synthesis, bio-

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-13 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) - (c); or (e) a nucleic acid encoding the polypeptide of (a) - (l) in a viruoleic acid encoding the early polypeptide of (a) - (l) has viruoleic and cytostatic activities, and can be used in vaccines. The methods and compositions of the present

                                                                                                                                                                                                                                                                                                                     The invention relates to a solid phase peptide synthesis method using a support consisting of a functionalised polystyrene-grafted polymer substrate. The peptides are prepared in high yield and purity. The process may be used for compartmentalised synthesis of a number of different peptides in parallel. The present sequence is one of 13 melittin. (7-21) analogues prepared in parallel by the process (AAR61460-R61470)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral
                                                                                                                                                 grafted with polystyrene - used in peptide synthesis giving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gарв

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) c(b) a nucleic acid encoding the polypeptide of (a)-(d); (I) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       epitope, epitope cluster, virucide, cytostatic, vaccine, viral infection, cancer, tumour, human, GAGE-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptides and encoding nucleic acids that are useful epitopes of target-associated antigens, useful for diagnosing and/or treating viral
invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                     Gaps

The present invention describes a polypeptide (I) comprising a component selected from: (a) a polypeptide epitope having any of the 503 fully defined sequences of 8-33 amino acids (SEQ ID NO:108-610); (b) an epitope cluster comprising the polypeptide of (a); (c) a polypeptide having substantial similarity to (a) or (b); (d) a polypeptide having functional similarity to any of (a) c(b); or (e) a mucleic acid encoding the polypeptide of (a) -(d). (T) has virucide and cytostatic activities, and can be used in vaccines. The methods and compositions of the present invention are useful for the diagnosis and/or treatment of viral infections, cancers and tumours. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 102,

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Disclosure; Page 33; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth. (TGF) factor betal (TGF-b) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides AAY92945-Y93133 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of simulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

The present invention relates to a set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of plant genomes. The present sequence is one such peptide from Arabidopsis thaliana. The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or herbicide. The peptides are also useful for tools for agricultural research and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGP) factor betal (TGP-1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGP-b1 and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
                                                                                                                                                                                                                                                                                                                                                                                                                       Hepatotropic, antagonist, transforming growth factor betal, TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor, liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to an avian pancreatic polypeptide, modified by substitution of at least one amino acid residue, where the residue is being exposed on the alpha helix domain of the polypeptide when the polypeptide is in a tertiary form. The polypeptide is useful for screening drugs to identify agents capable of binding to the same binding site as the avian pancreatic polypeptide. It is also useful for diagnostic purposes to identify the presence and/or detect the levels of DNA or protein that binds to the polypeptide, in treatment of diseases associated with the presence of a particular DNA or protein, where the polypeptide can be used to bind to DNA to promote or inhibit transcription and for identifying binding partners. The present sequence is that of a miniature protein and another molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Collection of capture compounds capable of binding to biomolecules to form complexes that are stable under mass spectrometry conditions, useful
modification by substitution of an amino acid residue, that is exposed the alpha helix domain of the polypeptide is useful for screening for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        matrix assisted laser desorption ionisation-time of flight; MALDI-TOF.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                               The invention relates to human I kappa B kinase inhibitor 37.40 (ABPSS974) and nucleic acids encoding it (ABZ70827). The protein has a molecular weight of 37.4 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic and the use of the protein, gene and antagonist in therapeutic treatment of a variety of diseases such as cancer, angiocardiopathy neurological disorders, immune disorders and inflammatory conditions. The present sequence represents the 15 N-terminal amino acids of human I kappa B kinase inhibitor 37.40 used in ELISA (enzyme linked immunosorbent assay) in an exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Avian pancreatic polypeptide; alpha helix domain; modulate transcription; miniature protein.

spectrometry conditions. The formulae for the capture compounds comprises sets of compounds of formula (I)-(III) given in the specification. Also included are analysis of biomolecules (by contacting a composition comprising a biomolecule with the above collection and identifying or detecting bound biomolecules), separating protein conformers (by contacting a composition comprising a biomolecule with the above collection, separating the members of the collection and identifying or contacting the mixture with the above collection and identifying bound proteins), reducing diversity of a complex mixture of biomolecules (by contacting the mixture with the above collection and separating each set of complexes of capture compounds with biomolecules from the other sets) and identifying phenotype-specific biomolecules (by sorting cells from a single subject into sets according to a phenotype, contacting mixtures of biomolecules from each set with the above collection and comparing the patterns of biomolecule binding from each set). The collection of capture compounds is useful for the analysis of contacting mass spectrometry, especially matrix assisted laser desorption ionisation time of flight (Mallol-TOP) mass spectrometry. The present sequence is an exemplate of the above collection of capture capture comporated into a capture is an exemplate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         compound of the invention

inflammation, metastasis and angiogenesis.

Tumour metastasis requires detachment of malignant cells from the primary tumour, penetration of blood or lymph vessels and attachment to the endochellum of distant organs, ultimately resulting in the formation of new tumours. The selectin family of adhesion molecules is implicated in this process. E-selectin is a calcium-dependent molecule expressed by activated vascular endothelium. E-selectins bind to glycoconjugates

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessaing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological response against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human.
                                                                                                                                               and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying a compound for treating Hepatitis C virus (HCV) infection by assessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell.
carrying a terminal tetrasaccharide Lewis antigen, which are found on tumour cell surfaces. One such Lewis antigen is sialyl (SA)-Lea. The binding of selectin molecules to their ligands is thought to be an important step in metastasis. Therefore, inhibition of E-selectindependent carbohydrate-mediated interactions is thought to be a target for anti-cancer therapy. The present sequence is a Human Family II peptido-mimetic of E-selectin-SA-Lea binding. This sequence blocks E-selectin-SA-Lea binding and therefore blocks adhesion of tumour cells a leukocytes to endothelial cells and hence metastasis. This sequence is therefore an E-selectin antagonist
                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological response against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human. The sequences shown in ABR00595-ABR00746 represent complementary peptides
                                                                                                                                                                 ö
The sequences shown in ABR00595-ABR00746 represent complementary peptides of varying lengths to the amphipathic helix of the HCV nonstructural protein NS5A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying a compound for treating Hepatitis C virus (HCV) infection by assessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell.

The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for treating hepatitis C virus (HCV) response against HCV. The peptides are useful for eliciting an immunological medicament for the prevention or treatment of HCV infection in a buwan. The sequences shown in ABRO0555-BABRO0456 represent complementary peptides of varying lengths to the amphipathic helix of the HCV nonstructural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying a compound for treating Hepatitis C virus (HCV) infection by assessaing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to oligomucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, anglopoletin, apoptosis related proteins, cadherin, cyclin, proteins, complement related proteins, cyclochromes, kinesins, cytokines, complement related proteins, cytochromes, kinesins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by one such oligomucleotide. The oligomucleotides and the peptide encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with the prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthitis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, brain, breast, colon and kidney, leukaemia), diseases of the nervous system and an infection of pathogenic organisms

The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an C HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological cespones against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human. The sequences shown in ABR00595-ABR00746 represent complementary peptides of varying lengths to the amphipathic helix of the HCV nonstructural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an C HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and chapatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological composition is useful for eliciting an immunological medicament for the prevention or treatment of HCV infection in a human. The sequences shown in ABR00595-ABR00746 represent complementary peptides
                                                                                                                                                                                                                                                                                                                                                             Identifying a compound for treating Hepatitis C virus (HCV) infection lassessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HCV; hepatitis C virus; amphipathic helix; N-terminal; hepatotropic; non-structural protein; virucide; gene therapy; immunological; NSSA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 29; DB 6; Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for identifying a compound useful for treating Hepatitis C virus (HCV) infection. The method comprises assessing the ability of a candidate compound to interfere with the binding of an amphipathic helix present in the N-terminal region of an HCV non-structural protein with cytoplasmic membranes of a eukaryotic cell, where a compound that interferes with the binding is useful for treating the infection. The compounds of the invention have virucide, and hepatotropic activity. The peptides may have a use in gene therapy. The methods and compounds are useful for treating Hepatitis C virus (HCV) infection. The composition is useful for eliciting an immunological response against HCV. The peptides are useful for the preparation of a medicament for the prevention or treatment of HCV infection in a human. The sequences shown in ABR00595-ABR00746 represent complementary peptides of varying lengths to the amphipathic helix of the HCV nonstructural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ģ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying a compound for treating Hepatitis C virus (HCV) infection lassessing the ability of a compound to interfere the binding of an amphipathic helix of an HCV nonstructural protein with cytoplasmic membranes of eukaryotic cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HCV; hepatitis C virus; amphipathic helix; N-terminal; hepatotropic; non-structural protein; virucide; gene therapy; immunological; NSSA;

A Steinborner S.T., Currie G.J., Bowie J.H., Wallace J.C., Tyler M.J.;

The wantibiotic caerin 1 peptides from the skin secretion of the australian tree frog Litoria caloris. Comparison of the activities of the caerin 1 peptides from the genus Litoria.";

L. Pept. Res. 5:1.21-126(1998).

- PUNCTION: Caeridins show neither neuropeptide activity nor antibiotic activity.

- PUNCTION: Caeridins show neither neuropeptide activity nor antibiotic activity.

- TISSUE SPECIFICITY: Secreted by the skin.

- TISSUE SPECIFICITY: Secreted by the Asp-4 residue in caeridin 1.2; a cyclic succiniminde may be formed between Asp-4 and Gly-5 residues in caeridin 1.3 (By similarity).

A Amidation; Amphibian defense peptide; Direct protein sequencing.

MOD RES 12 Leucine amide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -!- PTM: Isomerization alpha-beta of the Asp-4 residue in caeridin
1.2; a cyclic succinimide may be formed between Asp-4 and Gly-5
residues in caeridin 1.3 (By similarity)
-!- MASS SPECTROMETRY: MW=1139; METHOD=FAB; RANGE=1-12; NOTE=Ref.1.
Aust. J. Chem. 48:1981-1987(1995).
-!- FUNCTION: Caeridins show neither neuropeptide activity nor antibiotic activity.
-!- TISSUE SPECIFICITY. Specifically secreted by the skin parotoid and/or rostral glands.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiblotic activity.

"The structures of the frenatin peptides from the skin secretion of the giant tree frog Litoria infrafrenata.";

J. Pept. Sci. 2:117-124(1996).

-!- FUNCTION: Wide spectrum antimicrobial peptide.

-!- SUBCELLULAR LOCATION: Secreted.

-!- TISSUE SPECIFICITY: Expressed by the skin parotoid and/or rostral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention describes a DNA vaccine which comprises a plasmid containing 2-6 kb of the total antigen gene of hepatitis C virus (HCV). Also described: (I) a recombinant adenovirus vaccine including an adenovirus containing 2-6 kb of total antigen gene of HCV; (2) a vaccine including an infection. The DNA vaccine has virucide activity. The DNA vaccine is useful in treating or preventing HCV infection. The pNA vaccine is useful in treating or preventing HCV infection. The present sequence represents a peptide from the HCV peptide pool used for the investigation of cellular immune response in the exemplification of the present
  New DNA vaccine comprising plasmid containing 2-6 kb of the total antigen gene of hepatitis C virus'(HCV), useful in treating or preventing HCV

  The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-1) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-b1 and/or its receptors. Peptides ANY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-b1 to its receptors, e.g. they are inhibitors of stimulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis
  Hepatotropic, antagonist, transforming growth factor betal, TGF-bl; competitive inhibition; collagen synthesis stimulation inhibitor; liver; extracellular matrix degradation inhibitor; mimetope; cirrhosis.
   Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

The sequences given in AAR82556-57 are myelin basic protein (MBP) derived peptides which were used in the method of the invention for the treatment of multiple sclerosis. These peptides act as bystander antigens and act in combination with an amount of a non-interferon polypeptide having Th2-enhancing cytokine activity
  A set of peptide ligands for agricultural research and development of therapeutic agents comprise specific complementary peptides to proteins encoded by genes of plant genomes.

   AAB68429-33 represent peptides derived from a human G-protein coupled receptor, designated HGG7 or MCH-R2. HGG7 is a melanin concentrating hormone receptor. Modulators of HG67 can be used to treat a patient, particularly to reduce weight, particularly in obesity, or to treat stress. These modulators can also be used to treat cancer, reduce pain, treat sexual dysfunction or to produce weight gain. Bringing about weight loss can be used to reduce the likelihood of hypertension, diabetes, dyslipidemia, cardiovascular disease, gall stones, osteoarthritis or certain forms of cancers. Increasing weight can be useful in the treatment of anorexia, AlDS, wasting, cachexia and frail elderly patients, or those undergoing chemotherapy or radiation therapy

              The present invention relates to a set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of plant genomes. The present sequence is one such peptide from Arabidopsis thaliana. The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or herbicide. The peptides are also useful for tools for agricultural research and
  The invention relates to human I kappa B kinase inhibitor 37.40 (ABPS8974) and nucleic acids encoding it (ABZ70827). The protein has a molecular weight of 37.4 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. I kappa B kinase inhibitors 37.40 can be used in the treatment of a variety of diseases such as cancer, angiocardiopathy, neurological disorders, immune disorders and inflammatory conditions. The present sequence represents the 15 N-terminal amino acids of human I kappa B kinase inhibitor 37.40 used in ELISA (enzyme linked immunosorbent assay) in an exemplification of the invention

  The invention relates to an avian pancreatic polypeptide, modified by substitution of at least one amino acid residue, where the residue is being exposed on the alpha helix domain of the polypeptide when the polypeptide is in a tertiary form. The polypeptide is useful for screening drugs to identify agents capable of binding to the same binding site as the avian pancreatic polypeptide. It is also useful for diagnostic purposes to identify the presence and/or detect the levels of DNA or protein that binds to the polypeptide, in treatment of diseases associated with the presence of a particular DNA or protein, where the polypeptide can be used to bind to DNA to promote or inhibit transcription and for identifying binding partners. The present sequence is that of a miniature protein of the invention used to modulate the interaction between a known protein and another molecule
  Polypeptide scaffold e.g. an avian pancreatic polypeptide that comprises modification by substitution of an amino acid residue, that is exposed on the alpha helix domain of the polypeptide is useful for screening for

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino acids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibodies. The peptides and antibodies are also useful in detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for creating immune-related diseases, growth-related diseases, call seases, careation immune diseases, growth-related diseases, call sease, atherosclerosis, bacterial, fungal, protozoan or viral infections, atherosclerosis, bacterial, seteboprossis, cancer, cardiomyopathy, chronic and acute disease, parkinson's disease, multiple sclerosis, pain, psoriasis, cancer, depression, schizophrenia, dementia, mental retardation, memory loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and immunodiagnosis. ABZ42283 to ABZ42869 encode GPCR proteins given in ABS81675 to ABZ42289 encode ceremonal and content invention.

```
The invention relates to a composite binding polypeptide comprising a first natural binding domain derived from a first natural binding polypeptide and second natural binding domain derived from a first natural binding polypeptide, where the first and second natural binding polypeptide, where the first and second natural binding polypeptides. The invention also relates to a changer of polypeptides. The invention also relates to a changer of second binding polypeptides. The invention also relates to a changer of polypeptide comprising a binding polypeptide cited above and a biological effector domain, a library of natural binding domains. A library of catached to it, a method for selecting a binding polypeptide capable of binding to a target site and a method for designing a composite binding polypeptide. The methods and compositions of the present invention are useful for designing sequence-specific binding proteins for regulation of the diagnosis and transgenic animals of a method disorders, and as research tools and in transgenic animals. This sequence represents a human zinc finger DNA binding domain used in the scope of the invention

particularly mental disorders, including schizophrenia, depression, anxiety, attention deficit hyperactivity disorder, migraine, stroke, and neurodegenerative diseases such as Alzheimer's disease, parkinson's disease, glaucoma and macular degeneration, cardiovascular diseases such as ischaemia, congestive heart failure, arrythmia, high blood pressure as ischaemia, congestive heart failure, arrythmia, high blood pressure disorders, renal failure, inflammatory conditions, autoimmune disorders including rheumatoid arthritis, movement disorders, central nervous system disorders, infections, eating disorders, cardiovascular disorders including thrombosis and athersclerosis, and proliferative disorders such as cancers, hormonal disorders and sexual dysfunction. This is the amino acid sequence of a novel ion channel. The invention describes an isolated nucleic acid comprising a sequence encoding at least a portion of an ion channel (ion-x). The invention is useful to detect and treat diseases and conditions of the brain,

WPI; 2000-411935/35.

Peptides that antagonize binding of transforming growth factor betal, useful for treatment of liver disease, especially cirrhosis, are partial sequences of the factor or its receptors.

Claim 9; Page 82; 86pp; Spanish.

The invention relates to synthetic peptides that antagonise the binding of transforming growth (TGF) factor betal (TGF-bl) to its receptor in vivo which have partial amino acid sequences identical, or similar, with those of TGF-bl and/or its receptors. Peptides AAY92945-Y93131 represent examples of the peptides of the invention. The peptides act by competitive inhibition of the binding of TGF-bl to its receptors, e.g. they are inhibitors of simulation of collagen synthesis in liver cells and inhibitors of synthesis of proteolytic enzymes able to degrade the extracellular matrix. The peptides, their mimetopes and/or DNA (or expression systems) encoding the peptides are used for treatment of liver disease, specifically cirrhosis

The present sequence is a peptide which binds to thrombopoietin (TPO) receptor (TR). The compound can be used for treating patients suffering from haematological disorders and thrombocytopenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. The peptide may also be used to maintain the proliferation and growth of TPO-dependent cell lines and for use in biological research, for detecting
  Thrombopoietin receptor-binding/activating peptide(s) and peptide mimetic(s) - useful in treatment of haematological disorders, esp. thrombocytopenia resulting from chemotherapy, etc.
  Haematology; thrombocytopenia; TPO; TR; proliferation;
bone marrow transfusion; chemotherapy; radiation therapy.

  The present peptide, which binds the thrombopoietin receptor (TR), can be used to treat disorders which are susceptible to treatment with a thrombopoietin agonist, preferably haematological disorders and thrombocytopaenia resulting from chemotherapy, radiation therapy or bone marrow transfusions. It can also be used diagnostically, e.g. to investigate the mechanism of thrombopoietin signal transduction and receptor activation, or to maintain the proliferation and growth of thrombopoietin dependent cell lines

   The present invention describes composition of matter (1) comprising an FC domain, pharmacologically active peptides, and linkers. Where (1) is: (X1)5-P1-(X2)b, where: F1 = an FC domain; X1 and X2 = are each independently selected from -(I1)C-P1-(I2)G-P2, -(I1)C-P1-(I2)G-P2, -(I1)C-P1-(I2)G-P2-(I3)E-P3, or -(I1)C-P1-(I2)G-P3-(I4)F-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; IJ, IZ, IJ, and IA = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or I, provided that at least 1 of a and b is I. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be used for producing pharmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an FC domain (rather than a Pab domain) can provide a longer half-life or incorporate functions such as FC receptor binding, protein A binding, complement fixation, and cossibly placental transfer. Sequences AAU25815-AAU26049 represent peptides and peptide mimetics that
bind to and activate the human thrombopoletin receptor (TPD-R). Methods
of activating thrombopoletin receptors in cells comprise contacting the
cells with effective amounts of peptides and peptide mimetics attached to
cells with effective amounts of peptides and peptide mimetics attached to
chydrophilic polymers. The methods are used to treat thrombocytopenia auch
contacting the confemcifieraby, radiation therapy or bone-marrow
cransplantation and to prevent thrombocytopenia in patients at isk. The
sequences are used to treat and prevent haematological disorders
confluing thrombocytopenia and platelat disorders in vitro
as unique tools for understanding the biological role of thrombopoietin
consumption of develop other compounds that bind to and activate the TPO
ceeptor. The peptides can be used to detect TPO receptors on living
cells and fixed cells, in biological fluids, in tissue homogenates, and
consumption of mutural biological materials. They may also be used for in
situ staining, fluorescence-activated cell sorting, western blotting and
consume.linked immunosorbent assay (ELISA). In addition, the peptides can
be used for in vitro expansion of megakarycytes and their committed
consumptical alone or in conjunction with additional cytokines

The present invention describes a ventice-peptice molecule (1) or its multimers. (1) can have autiinflammatory, antitumour, immunosuppressive, cytostatic, antirheumatic, antianthritic, antidiabetic, ophthalmological and anterpretetive activities. (1) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (1) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a biological sample. Additionally, (1) is useful for treating inflammatory and autoimmune diseases, unmour growth, cancer, returnating inflammatory and autoimmune diseases. (1), comprising confertility, and neurological degenerative diseases. (1), comprising compounds are useful for treating disorders characterised by low mimetic compounds are useful for treating disorders characterised by compounds are useful for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet compounds are useful in thrombocytopaenia, systemic lupus erythematosus, and Fanconi's syndrome. This invention relates to novel mammalian CDR mimetibodies, specific fragment where a protein has been inserted into, or replaces a portion of fragment where a protein has been inserted into, or replaces a portion of of one or more CDR regions, such that each CDR mimetibody comprises at least one human framework region and at least one itself comprises at least one human framework region and at least one ligand binding region (LDR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modilating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/ or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is a TPO mimetic peptide sequence used to make a mimetibody of the invention.

This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antiganic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present sequence is that of a hepatitis C virus CTL epitope peptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                                                                               pathogenic virus; alternative reading frame; antigenic determinant; virucide; vaccine; therapeutic agent; infection; epitope peptide; HLA-allele; CTL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 32; DB 8; Length 10;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention relates to a novel polypeptide encoded by an alternative reading frame of a pathogenic virus, where the polypeptide starts with a methionine amino acid residue, which comprises an antigachic determinant and more than 7 amino acid residues. The invention may be useful for the production of compounds with a virucide activity or the development of a vaccine. The polypeptide or its fragments may be useful as a therapeutic agent. It is also useful for the manufacture of a medicament for treating or preventing an infection with the pathogenic virus. The present
                                                                                 The present invention describes human thyroglobulin 38 protein (I). (I) and has cytostatic and antilinflammatory activities. (I) and the polynucleotide (II) encoding it can be used in the treatment of diseases such as simple goitre, thyroiditis, hyperthyroidism, hypothyroidism, thyroid tumour and nodular goitre. The present sequence represents the N-terminal peptide of human thyroglobulin 38, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide encoded by an alternative reading frame of a pathogenic virus comprising an antigenic determinant, useful for treating or preventing an infection with the pathogenic virus.
                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes a type II restriction endonuclease, designated PspGI, from Pyrococcus species G-I-H. The endonuclease recognises and cleaves the following base sequence before the first C at the 5' end, to give a five base overhang at the 5' end; 5'-CC(A/T)GG-3'. Also described are: (1) isolated DNA (1) obtainable from Pyrococcus species G-I-H and coding for the PspGI restriction endonuclease; (2) isolated DNA (II) obtainable from ATCC No. 98435 and coding for the PspGI restriction endonuclease; (2) isolated DNA (II) obtainable from ATCC No. 98435 and coding for the PspGI cestriction endonuclease and methylase; (3) a recombinant DNA vector into which (1) is inserted; (4) a cloning vector comprising (II); and (5) a chart cell transformed with the vector as in (3) or (4). The endonuclease can be isolated using conventional protein purification techniques from Pyrococcus sp. G-I-H. Alternatively, the endonuclease, along with its corresponding methylase can be obtained using recombinant DNA techniques. Restriction endonuclease PspGI is useful in genetic engineering. The DNA, vectors and host cells are all useful for recombinantly producing the endonuclease in commercial quantities. The present sequence represents motif IV from the PspGI methylase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New Type II restriction endonuclease from Pyrococcus species G-I-H - and DNA coding for the endonuclease, optionally with its methylase for recombinant production of the restriction enzyme.
                                                                                                          PspGI; type II restriction endonuclease; Pyrococcus; methylase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

"I create in the integration of information within the brain. May be involved in the control of visceral muscles due to its ability to behave as potent inhibitors of peristalic movements. May also tulfill a neurohormonal role on muscles of the gut and heart.

"I ISSUE SPECIFICITY: Neurons within brain and abdominal ganglion."

"I SIMILARITY: Belongs to the allactostatin family.
